

Callum Mudgway – MDDN201 – Project 2 Proposal

For my website I want to construct the home page, log in/sign up and profiles. By linking all these pages the user will get a good feel on what the website should be like. By using OBS and twitch T.V, I am able to embed live streams to portray the effect of my initial concept.

I will be making this website in the text editor Atom, with the coding languages of HTML, CSS and some JavaScript. This will be enough to construct a good looking website.

Tutorials:

OBS – I will use this Open broadcaster Software to have streams in my webpage. By creating a twitch account I will be able to stream live videos. This software will let me embed my twitch live streams in my webpage so I can re create my live streaming effect of my website concept.

<http://help.twitch.tv/customer/portal/articles/1262922-open-broadcaster-software>

JavaScript – I will use this type of coding language to make my website more interactive. Making these pages more interactive and user friendly will attract more people to check out the website.

Git – When working with code I find a lot of bugs. By using Git I can maintain my updated files without copying them thousands of times. This is to make my work process easier and faster.
